## COSMETICS

### Development of novel sun cream

#### THE APPLICATION SCOPE / PURPOSE

Sun cream is applied to the skin to protect it from sun rays. There are two main types of sun creams: products that penetrate the outermost layer of the skin to absorb ultraviolet rays or products that cover the skin surface and provide a physical barrier. In both cases, the Sun Protection Factor (SPF) determines the length of protection of the skin from the sun. The development for sun creams is a huge market. Kinematica offers equipment for the production of sun creams on a laboratory scale to carry out such developments with small volumes. At the same time scaling up to a production scale can follow without any difficulty.
