Hair gel from lab to production

THE APPLICATION SCOPE / PURPOSE

Hair gel is an aqueous or water-alcohol solution based on polymers, which is applied to the hair as a hair styling agent. The polymers form a film around the hair and strengthen it. The gelling of the gel during the production of the hair gel is based on a change in pH. pH control is absolutely essential. Kinematica offers solutions for the controlled production of hair gels, from the laboratory area for research and development to the scaled production area.
