COSMETICS

Mascara production at high viscosities

THE APPLICATION SCOPE / PURPOSE

Mascara is a cosmetic product that is applied to lengthen, tint and thicken the lashes. The base consists of a high content of pigments, oils, waxes and preservatives. In the USA the use of coal and tar for eye products is not allowed, therefore manufacturers mainly use natural colours and inorganic pigments. Due to the high viscosity and high pigment content, dispersion of the mixture is very difficult and should be done without the inclusion of air. Kinematica offers equipment and experience for the application of mascara with the desired process properties.
