Sample preparation for pesticide residue analysis

THE APPLICATION SCOPE / PURPOSE

The analysis of pesticide residues on food has become standard practice, as it is done, for example, for nuts, sultanas or figs. To be able to make a representative analysis, a sufficiently large sample must be taken and efficiently homogenised. The variety of consistency of the possible samples, whether hard, rubbery, soft, gel-like or even fibrous, makes standardized sample preparation difficult. Kinematica offers solutions for this quality analysis for different sample sizes and has a variety of aggregates for every sample consistency.
